

### Exercise 4.3

In a  $\Delta ABC$ , AD is the bisector of  $\angle A$ , meeting side BC at D.

(i) if  $BD = 2.5$  cm,  $AB = 5$  cm, and  $AC = 4.2$  cm, find DC.

**Solution:**

Given:  $\Delta ABC$  and AD bisects  $\angle A$ , meeting side BC at D. And  $BD = 2.5$  cm,  $AB = 5$  cm, and  $AC = 4.2$  cm.

Required to find: DC

Since, AD is the bisector of  $\angle A$  meeting side BC at D in  $\Delta ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{5}{4.2} = \frac{2.5}{DC}$$

$$5DC = 2.5 \times 4.2$$

$$\therefore DC = 2.1 \text{ cm}$$

(ii) if  $BD = 2$  cm,  $AB = 5$  cm, and  $DC = 3$  cm, find AC.

**Solution:**

Given:  $\Delta ABC$  and AD bisects  $\angle A$ , meeting side BC at D. And  $BD = 2$  cm,  $AB = 5$  cm, and  $DC = 3$  cm.

Required to find: AC

Since, AD is the bisector of  $\angle A$  meeting side BC at D in  $\Delta ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{5}{AC} = \frac{2}{3}$$

$$2AC = 5 \times 3$$

$$\therefore AC = 7.5 \text{ cm}$$

## R D Sharma Solutions For Class 10 Maths Chapter 4 - Triangles

(iii) if  $AB = 3.5$  cm,  $AC = 4.2$  cm, and  $DC = 2.8$  cm, find  $BD$ .

**Solution:**

Given:  $\triangle ABC$  and  $AD$  bisects  $\angle A$ , meeting side  $BC$  at  $D$ . And  $AB = 3.5$  cm,  $AC = 4.2$  cm, and  $DC = 2.8$  cm.

Required to find:  $BD$

Since,  $AD$  is the bisector of  $\angle A$  meeting side  $BC$  at  $D$  in  $\triangle ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{3.5}{4.2} = \frac{BD}{2.8}$$

$$4.2 \times BD = 3.5 \times 2.8$$

$$BD = \frac{7}{3}$$

$$\therefore BD = 2.3 \text{ cm}$$

(iv) if  $AB = 10$  cm,  $AC = 14$  cm, and  $BC = 6$  cm, find  $BD$  and  $DC$ .

**Solution:**

Given: In  $\triangle ABC$ ,  $AD$  is the bisector of  $\angle A$  meeting side  $BC$  at  $D$ . And,  $AB = 10$  cm,  $AC = 14$  cm, and  $BC = 6$  cm

Required to find:  $BD$  and  $DC$ .

Since,  $AD$  is bisector of  $\angle A$

We have,

$$\frac{AB}{AC} = \frac{BD}{DC} \quad (\text{AD is bisector of } \angle A \text{ and side BC})$$

$$\text{Then, } \frac{10}{14} = \frac{x}{(6-x)}$$

$$14x = 60 - 6x$$

$$20x = 60$$

## R D Sharma Solutions For Class 10 Maths Chapter 4 - Triangles

$$x = 60/20$$

$$\therefore BD = 3 \text{ cm and } DC = (6 - 3) = 3 \text{ cm.}$$

(v) if  $AC = 4.2 \text{ cm}$ ,  $DC = 6 \text{ cm}$ , and  $BC = 10 \text{ cm}$ , find  $AB$ .

**Solution:**

Given:  $\Delta ABC$  and  $AD$  bisects  $\angle A$ , meeting side  $BC$  at  $D$ . And  $AC = 4.2 \text{ cm}$ ,  $DC = 6 \text{ cm}$ , and  $BC = 10 \text{ cm}$ .

Required to find:  $AB$

Since,  $AD$  is the bisector of  $\angle A$  meeting side  $BC$  at  $D$  in  $\Delta ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{AB}{4.2} = \frac{BD}{6}$$

We know that,

$$BD = BC - DC = 10 - 6 = 4 \text{ cm}$$

$$\Rightarrow \frac{AB}{4.2} = \frac{4}{6}$$

$$AB = \frac{(2 \times 4.2)}{3}$$

$$\therefore AB = 2.8 \text{ cm}$$

(vi) if  $AB = 5.6 \text{ cm}$ ,  $AC = 6 \text{ cm}$ , and  $DC = 3 \text{ cm}$ , find  $BC$ .

**Solution:**

Given:  $\Delta ABC$  and  $AD$  bisects  $\angle A$ , meeting side  $BC$  at  $D$ . And  $AB = 5.6 \text{ cm}$ ,  $AC = 6 \text{ cm}$ , and  $DC = 3 \text{ cm}$ .

Required to find:  $BC$

## R D Sharma Solutions For Class 10 Maths Chapter 4 - Triangles

Since, AD is the bisector of  $\angle A$  meeting side BC at D in  $\Delta ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{5.6}{6} = \frac{BD}{3}$$

$$BD = \frac{5.6}{2} = 2.8 \text{ cm}$$

And, we know that,

$$BD = BC - DC$$

$$2.8 = BC - 3$$

$$\therefore BC = 5.8 \text{ cm}$$

(vii) if  $AB = 5.6 \text{ cm}$ ,  $BC = 6 \text{ cm}$ , and  $BD = 3.2 \text{ cm}$ , find AC.

**Solution:**

Given:  $\Delta ABC$  and AD bisects  $\angle A$ , meeting side BC at D. And  $AB = 5.6 \text{ cm}$ ,  $BC = 6 \text{ cm}$ , and  $BD = 3.2 \text{ cm}$ .

Required to find: AC

Since, AD is the bisector of  $\angle A$  meeting side BC at D in  $\Delta ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{5.6}{AC} = \frac{3.2}{DC}$$

And, we know that

$$BD = BC - DC$$

$$3.2 = 6 - DC$$

$$\therefore DC = 2.8 \text{ cm}$$

$$\Rightarrow \frac{5.6}{AC} = \frac{3.2}{2.8}$$

# R D Sharma Solutions For Class 10 Maths Chapter 4 - Triangles

$$AC = (5.6 \times 2.8) / 3.2$$

$$\therefore AC = 4.9 \text{ cm}$$

**(viii) if AB = 10 cm, AC = 6 cm, and BC = 12 cm, find BD and DC.**

**Solution:**

Given:  $\Delta ABC$  and AD bisects  $\angle A$ , meeting side BC at D. AB = 10 cm, AC = 6 cm, and BC = 12 cm.

Required to find: DC

Since, AD is the bisector of  $\angle A$  meeting side BC at D in  $\Delta ABC$

$$\Rightarrow \frac{AB}{AC} = \frac{BD}{DC}$$

$$\frac{10}{6} = \frac{BD}{DC} \dots\dots\dots (i)$$

And, we know that

$$BD = BC - DC = 12 - DC$$

Let  $BD = x$ ,

$$\Rightarrow DC = 12 - x$$

Thus (i) becomes,

$$\frac{10}{6} = \frac{x}{12 - x}$$

$$5(12 - x) = 3x$$

$$60 - 5x = 3x$$

$$\therefore x = \frac{60}{8} = 7.5$$

Hence,  $DC = 12 - 7.5 = 4.5 \text{ cm}$  and  $BD = 7.5 \text{ cm}$

**2. In figure 4.57, AE is the bisector of the exterior  $\angle CAD$  meeting BC produced in E. If AB = 10 cm, AC = 6 cm, and BC = 12 cm, find CE.**

**Solution:**

Given: AE is the bisector of the exterior  $\angle CAD$  and AB = 10 cm, AC = 6 cm, and BC = 12 cm.

Required to find: CE

# R D Sharma Solutions For Class 10 Maths Chapter 4 - Triangles

Since AE is the bisector of the exterior  $\angle CAD$ .

$$BE / CE = AB / AC$$

Let's take CE as x.

So, we have

$$BE / CE = AB / AC$$

$$(12+x) / x = 10 / 6$$

$$6x + 72 = 10x$$

$$10x - 6x = 72$$

$$4x = 72$$

$$\therefore x = 18$$

Therefore, CE = 18 cm.

**3. In fig. 4.58,  $\triangle ABC$  is a triangle such that  $AB/AC = BD/DC$ ,  $\angle B = 70^\circ$ ,  $\angle C = 50^\circ$ , find  $\angle BAD$ .**

**Solution:**

Given:  $\triangle ABC$  such that  $AB/AC = BD/DC$ ,  $\angle B = 70^\circ$  and  $\angle C = 50^\circ$

Required to find:  $\angle BAD$

We know that,

In  $\triangle ABC$ ,

$$\angle A = 180 - (70 + 50)$$

$$= 180 - 120$$

$$= 60^\circ$$

[Angle sum property of a triangle]

Since,

$$AB/AC = BD/DC,$$

AD is the angle bisector of angle  $\angle A$ .

Thus,

$$\angle BAD = \angle A/2 = 60/2 = 30^\circ$$
