

### Exercise 8(B)

1. Express in terms of log 2 and log 3:

(i) log 36

(ii) log 144

(iii) log 4.5

(iv) log 26/51 - log 91/119

(v) log 75/16 - 2log 5/9 + log 32/243

Solution:

$$\begin{aligned} \text{(i) } \log 36 &= \log (2 \times 2 \times 3 \times 3) \\ &= \log (2^2 \times 3^2) \\ &= \log 2^2 + \log 3^2 && [\text{Using } \log_a mn = \log_a m + \log_a n] \\ &= 2\log 2 + 2\log 3 && [\text{Using } \log_a m^n = n\log_a m] \end{aligned}$$

$$\begin{aligned} \text{(ii) } \log 144 &= \log (2 \times 2 \times 2 \times 2 \times 3 \times 3) \\ &= \log (2^4 \times 3^2) \\ &= \log 2^4 + \log 3^2 && [\text{Using } \log_a mn = \log_a m + \log_a n] \\ &= 4\log 2 + 2\log 3 && [\text{Using } \log_a m^n = n\log_a m] \end{aligned}$$

$$\begin{aligned} \text{(iii) } \log 4.5 &= \log 45/10 \\ &= \log (5 \times 3 \times 3) / (5 \times 2) \\ &= \log 3^2/2 \\ &= \log 3^2 - \log 2 && [\text{Using } \log_a m/n = \log_a m - \log_a n] \\ &= 2\log 3 - \log 2 && [\text{Using } \log_a m^n = n\log_a m] \end{aligned}$$

$$\begin{aligned} \text{(iv) } \log 26/51 - \log 91/119 &= \log (26/51) / (91/119) && [\text{Using } \log_a m - \log_a n = \log_a m/n] \\ &= \log [(26/51) \times (119/91)] \\ &= \log (2 \times 13 \times 7 \times 117) / (3 \times 17 \times 7 \times 13) \\ &= \log 2/3 \\ &= \log 2 - \log 3 && [\text{Using } \log_a m/n = \log_a m - \log_a n] \end{aligned}$$

$$\begin{aligned} \text{(v) } \log 75/16 - 2\log 5/9 + \log 32/243 & \\ &= \log 75/16 - \log (5/9)^2 + \log 32/243 && [\text{Using } n\log_a m = \log_a m^n] \\ &= \log 75/16 - \log 25/81 + \log 32/243 \\ &= \log [(75/16) / (25/81)] + \log 32/243 && [\text{Using } \log_a m - \log_a n = \log_a m/n] \\ &= \log (75 \times 81) / (16 \times 25) + \log 32/243 \\ &= \log (3 \times 81)/16 + \log 32/243 \\ &= \log 243/16 + \log 32/243 \\ &= \log (243/16) \times (32/243) && [\text{Using } \log_a m + \log_a n = \log_a mn] \\ &= \log 32/16 \\ &= \log 2 \end{aligned}$$

2. Express each of the following in a form free from logarithm:

(i)  $2 \log x - \log y = 1$

(ii)  $2 \log x + 3 \log y = \log a$

(iii)  $a \log x - b \log y = 2 \log 3$

**Solution:**

(i) We have,  $2 \log x - \log y = 1$

Then,

$$\log x^2 - \log y = 1$$

$$\log x^2/y = 1$$

Now, on removing log we have

$$x^2/y = 10^1$$

$$\Rightarrow x^2 = 10y$$

$$[\text{Using } n \log_a m = \log_a m^n]$$

$$[\text{Using } \log_a m - \log_a n = \log_a m/n]$$

(ii) We have,  $2 \log x + 3 \log y = \log a$

Then,

$$\log x^2 + \log y^3 = \log a$$

$$\log x^2 y^3 = \log a$$

Now, on removing log we have

$$x^2 y^3 = a$$

$$[\text{Using } n \log_a m = \log_a m^n]$$

$$[\text{Using } \log_a m + \log_a n = \log_a mn]$$

(iii)  $a \log x - b \log y = 2 \log 3$

Then,

$$\log x^a - \log y^b = \log 3^2$$

$$\log x^a/y^b = \log 3^2$$

Now, on removing log we have

$$x^a/y^b = 3^2$$

$$\Rightarrow x^2 = 9y^b$$

$$[\text{Using } n \log_a m = \log_a m^n]$$

$$[\text{Using } \log_a m - \log_a n = \log_a m/n]$$

**3. Evaluate each of the following without using tables:**

(i)  $\log 5 + \log 8 - 2 \log 2$

(ii)  $\log_{10} 8 + \log_{10} 25 + 2 \log_{10} 3 - \log_{10} 18$

(iii)  $\log 4 + 1/3 \log 125 - 1/5 \log 32$

**Solution:**

(i) We have,  $\log 5 + \log 8 - 2 \log 2$

$$= \log 5 + \log 8 - \log 2^2$$

$$= \log 5 + \log 8 - \log 4$$

$$= \log (5 \times 8) - \log 4$$

$$= \log 40 - \log 4$$

$$= \log 40/4$$

$$= \log 10$$

$$= 1$$

$$[\text{Using } n \log_a m = \log_a m^n]$$

$$[\text{Using } \log_a m + \log_a n = \log_a mn]$$

$$[\text{Using } \log_a m - \log_a n = \log_a m/n]$$

(ii) We have,  $\log_{10} 8 + \log_{10} 25 + 2 \log_{10} 3 - \log_{10} 18$

$$= \log_{10} 8 + \log_{10} 25 + \log_{10} 3^2 - \log_{10} 18$$

$$= \log_{10} 8 + \log_{10} 25 + \log_{10} 9 - \log_{10} 18$$

$$= \log_{10} (8 \times 25 \times 9) - \log_{10} 18$$

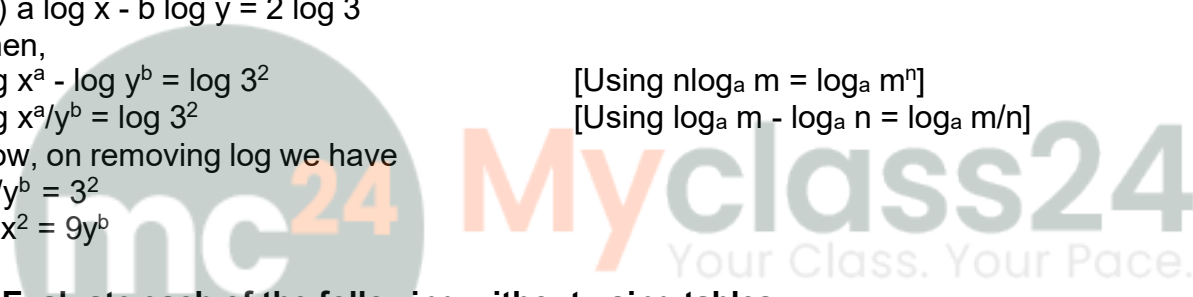

$$= \log_{10} 1800 - \log_{10} 18$$

$$= \log_{10} 1800/18$$

$$[\text{Using } n \log_a m = \log_a m^n]$$

$$[\text{Using } \log_a l + \log_a m + \log_a n = \log_a lmn]$$

$$[\text{Using } \log_a m - \log_a n = \log_a m/n]$$

$$\begin{aligned}
 &= \log_{10} 100 \\
 &= \log_{10} 10^2 \\
 &= 2\log_{10} 10 && \text{[Using } \log_a m^n = n\log_a m \text{]} \\
 &= 2 \times 1 \\
 &= 2
 \end{aligned}$$

(iii) We have,  $\log 4 + \frac{1}{3}\log 125 - \frac{1}{5}\log 32$

$$\begin{aligned}
 &= \log 4 + \log (125)^{1/3} - \log (32)^{1/5} && \text{[Using } n\log_a m = \log_a m^n \text{]} \\
 &= \log 4 + \log (5^3)^{1/3} - \log (2^5)^{1/5} \\
 &= \log 4 + \log 5 - \log 2 \\
 &= \log (4 \times 5) - \log 2 && \text{[Using } \log_a m + \log_a n = \log_a mn \text{]} \\
 &= \log 20 - \log 2 \\
 &= \log \frac{20}{2} && \text{[Using } \log_a m - \log_a n = \log_a m/n \text{]} \\
 &= \log 10 \\
 &= 1
 \end{aligned}$$

**4. Prove that:**

$$\mathbf{2\log 15/18 - \log 25/162 + \log 4/9 = \log 2}$$

**Solution:**

Taking L.H.S.,

$$\begin{aligned}
 &= 2\log 15/18 - \log 25/162 + \log 4/9 \\
 &= \log (15/18)^2 - \log 25/162 + \log 4/9 && \text{[Using } n\log_a m = \log_a m^n \text{]} \\
 &= \log \frac{225}{324} - \log \frac{25}{162} + \log \frac{4}{9} \\
 &= \log \left[ \frac{(225/324)}{(25/162)} \right] + \log \frac{4}{9} && \text{[Using } \log_a m - \log_a n = \log_a m/n \text{]} \\
 &= \log \frac{(225 \times 162)}{(324 \times 25)} + \log \frac{4}{9} \\
 &= \log \frac{(9 \times 1)}{(2 \times 1)} + \log \frac{4}{9} && \text{[Using } \log_a m + \log_a n = \log_a mn \text{]} \\
 &= \log \frac{9}{2} + \log \frac{4}{9} \\
 &= \log \left( \frac{9}{2} \times \frac{4}{9} \right) \\
 &= \log 2 \\
 &= \text{R.H.S.}
 \end{aligned}$$

**5. Find x, if:**

$$\mathbf{x - \log 48 + 3 \log 2 = \frac{1}{3} \log 125 - \log 3.}$$

**Solution:**

We have,

$$x - \log 48 + 3 \log 2 = \frac{1}{3} \log 125 - \log 3$$

Solving for x, we have

$$\begin{aligned}
 x &= \log 48 - 3 \log 2 + \frac{1}{3} \log 125 - \log 3 \\
 &= \log 48 - \log 2^3 + \log 125^{1/3} - \log 3 && \text{[Using } n\log_a m = \log_a m^n \text{]} \\
 &= \log 48 - \log 8 + \log (5^3)^{1/3} - \log 3 \\
 &= (\log 48 - \log 8) + (\log 5 - \log 3) \\
 &= \log \frac{48}{8} + \log \frac{5}{3} && \text{[Using } \log_a m - \log_a n = \log_a m/n \text{]} \\
 &= \log \left( \frac{48}{8} \times \frac{5}{3} \right) && \text{[Using } \log_a m + \log_a n = \log_a mn \text{]} \\
 &= \log (2 \times 5)
 \end{aligned}$$

$$\begin{aligned} &= \log 10 \\ &= 1 \\ \text{Hence, } x &= 1 \end{aligned}$$

**6. Express  $\log_{10} 2 + 1$  in the form of  $\log_{10} x$ .**

**Solution:**

$$\begin{aligned} \text{Given, } \log_{10} 2 + 1 & \\ &= \log_{10} 2 + \log_{10} 10 && [\text{As, } \log_{10} 10 = 1] \\ &= \log_{10} (2 \times 10) && [\text{Using } \log_a m + \log_a n = \log_a mn] \\ &= \log_{10} 20 \end{aligned}$$

**7. Solve for x:**

**(i)  $\log_{10} (x - 10) = 1$**

**(ii)  $\log (x^2 - 21) = 2$**

**(iii)  $\log (x - 2) + \log (x + 2) = \log 5$**

**(iv)  $\log (x + 5) + \log (x - 5) = 4 \log 2 + 2 \log 3$**

**Solution:**

(i) We have,  $\log_{10} (x - 10) = 1$

Then,

$$x - 10 = 10^1$$

$$x = 10 + 10$$

$$\text{Hence, } x = 20$$

(ii) We have,  $\log (x^2 - 21) = 2$

Then,

$$x^2 - 21 = 10^2$$

$$x^2 - 21 = 100$$

$$x^2 = 100 + 21$$

$$x^2 = 121$$

Taking square root on both sides,

$$\text{Hence, } x = \pm 11$$

(iii) We have,  $\log (x - 2) + \log (x + 2) = \log 5$

Then,

$$\log (x - 2)(x + 2) = \log 5$$

$$\log (x^2 - 2^2) = \log 5$$

$$\log (x^2 - 4) = \log 5$$

Removing log on both sides, we get

$$x^2 - 4 = 5$$

$$x^2 = 5 + 4$$

$$x^2 = 9$$

Taking square root on both sides,

$$x = \pm 3$$

(iv) We have,  $\log(x + 5) + \log(x - 5) = 4 \log 2 + 2 \log 3$

Then,

$$\log(x + 5) + \log(x - 5) = \log 2^4 + \log 3^2$$

[Using  $n \log_a m = \log_a m^n$ ]

$$\log(x + 5)(x - 5) = \log 16 + \log 9$$

[Using  $\log_a m + \log_a n = \log_a mn$ ]

$$\log(x^2 - 5^2) = \log(16 \times 9)$$

[As  $(x - a)(x + a) = x^2 - a^2$ ]

$$\log(x^2 - 25) = \log 144$$

Removing log on both sides, we have

$$x^2 - 25 = 144$$

$$x^2 = 144 + 25$$

$$x^2 = 169$$

Taking square root on both sides, we get

$$x = \pm 13$$

### 8. Solve for x:

(i)  $\log 81 / \log 27 = x$

(ii)  $\log 128 / \log 32 = x$

(iii)  $\log 64 / \log 8 = \log x$

(iv)  $\log 225 / \log 15 = \log x$

**Solution:**

(i) We have,  $\log 81 / \log 27 = x$

$$x = \log 81 / \log 27$$

$$= \log(3 \times 3 \times 3 \times 3) / \log(3 \times 3 \times 3)$$

$$= \log 3^4 / \log 3^3$$

$$= (4 \log 3) / (3 \log 3)$$

$$= 4/3$$

[Using  $\log_a m^n = n \log_a m$ ]

Hence,  $x = 4/3$

(ii) We have,  $\log 128 / \log 32 = x$

$$x = \log 128 / \log 32$$

$$= \log(2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2) / \log(2 \times 2 \times 2 \times 2 \times 2)$$

$$= \log 2^7 / \log 2^5$$

$$= (7 \log 2) / (5 \log 2)$$

[Using  $\log_a m^n = n \log_a m$ ]

$$= 7/5$$

Hence,  $x = 7/5$

(iii)  $\log 64 / \log 8 = \log x$

$$\log x = \log 64 / \log 8$$

$$= \log(2 \times 2 \times 2 \times 2 \times 2 \times 2) / \log(2 \times 2 \times 2)$$

$$= \log 2^6 / \log 2^3$$

$$= (6 \log 2) / (3 \log 2)$$

[Using  $\log_a m^n = n \log_a m$ ]

$$= 6/3$$

$$= 2$$

So,  $\log x = 2$

Hence,  $x = 10^2 = 100$

(iv) We have,  $\log 225/\log 15 = \log x$

$$\log x = \log 225/\log 15$$

$$= \log (15 \times 15)/\log 15$$

$$= \log 15^2/\log 15$$

$$= (2\log 15)/\log 15$$

$$= 2$$

[Using  $\log_a m^n = n\log_a m$ ]

So,  $\log x = 2$

$$\text{Hence, } x = 10^2 = 100$$

**9. Given  $\log x = m + n$  and  $\log y = m - n$ , express the value of  $\log 10x/y^2$  in terms of  $m$  and  $n$ .**

**Solution:**

Given,  $\log x = m + n$  and  $\log y = m - n$

Now consider  $\log 10x/y^2$ ,

$$\log 10x/y^2 = \log 10x - \log y^2$$

[Using  $\log_a m/n = \log_a m - \log_a n$ ]

$$= \log 10x - 2\log y$$

$$= \log 10 + \log x - 2\log y$$

$$= 1 + (m + n) - 2(m - n)$$

$$= 1 + m + n - 2m + 2n$$

$$= 1 + 3n - m$$

**10. State, true or false:**

(i)  $\log 1 \times \log 1000 = 0$

(ii)  $\log x/\log y = \log x - \log y$

(iii) If  $\log 25/\log 5 = \log x$ , then  $x = 2$

(iv)  $\log x \times \log y = \log x + \log y$

**Solution:**

(i) We have,  $\log 1 \times \log 1000 = 0$

Now,

$$\log 1 = 0 \text{ and}$$

$$\log 1000 = \log 10^3 = 3\log 10 = 3$$

[Using  $\log_a m^n = n\log_a m$ ]

So,

$$\log 1 \times \log 1000 = 0 \times 3 = 0$$

Thus, the statement  $\log 1 \times \log 1000 = 0$  is true

(ii) We have,  $\log x/\log y = \log x - \log y$

We know that,

$$\log x/y = \log x - \log y$$

So,

$$\log x/\log y \neq \log x - \log y$$

Thus, the statement  $\log x/\log y = \log x - \log y$  is false

(iii) We have,  $\log 25/\log 5 = \log x$

$$\log (5 \times 5)/\log 5 = \log x$$

$$\log 5^2/\log 5 = \log x$$

$$2\log 5/\log 5 = \log x$$

$$[Using \log_a m^n = n\log_a m]$$

$$2 = \log x$$

$$So, x = 10^2$$

$$x = 100$$

Thus, the statement  $x = 2$  is false

(iv) We know,  $\log x + \log y = \log xy$

So,

$$\log x + \log y \neq \log x \times \log y$$

Thus, the statement  $\log x + \log y = \log x \times \log y$  is false

**11. If  $\log_{10} 2 = a$  and  $\log_{10} 3 = b$ ; express each of the following in terms of 'a' and 'b':**

**(i)  $\log 12$**

**(ii)  $\log 2.25$**

**(iii)  $\log 2\frac{1}{4}$**

**(iv)  $\log 5.4$**

**(v)  $\log 60$**

**(iv)  $\log 3\frac{1}{8}$**

**Solution:**

Given that  $\log_{10} 2 = a$  and  $\log_{10} 3 = b \dots (1)$

(i)  $\log 12 = \log (2 \times 2 \times 3)$

$$= \log (2 \times 2) + \log 3$$

$$[Using \log_a mn = \log_a m + \log_a n]$$

$$= \log 2^2 + \log 3$$

$$= 2\log 2 + \log 3$$

$$[Using \log_a m^n = n\log_a m]$$

$$= 2a + b$$

$$[From 1]$$

(ii)  $\log 2.25 = \log 225/100$

$$= \log (25 \times 9)/(25 \times 4)$$

$$= \log 9/4$$

$$= \log (3/2)^2$$

$$= 2\log 3/2$$

$$[Using \log_a m^n = n\log_a m]$$

$$= 2(\log 3 - \log 2)$$

$$[Using \log_a m/n = \log_a m - \log_a n]$$

$$= 2(b - a)$$

$$[From 1]$$

$$= 2b - 2a$$

(iii)  $\log 2\frac{1}{4} = \log 9/4$

$$= \log (3/2)^2$$

$$\begin{aligned}
 &= 2\log 3/2 && [\text{Using } \log_a m^n = n\log_a m] \\
 &= 2(\log 3 - \log 2) && [\text{Using } \log_a m/n = \log_a m - \log_a n] \\
 &= 2(b - a) && [\text{From 1}] \\
 &= 2b - 2a
 \end{aligned}$$

$$\begin{aligned}
 \text{(iv) } \log 5.4 &= \log 54/10 \\
 &= \log (2 \times 3 \times 3 \times 3)/10 \\
 &= \log (2 \times 3^3) - \log 10 && [\text{Using } \log_a m/n = \log_a m - \log_a n] \\
 &= \log 2 + \log 3^3 - 1 && [\text{Using } \log_a mn = \log_a m + \log_a n \text{ and } \log 10 = 1] \\
 &= \log 2 + 3\log 3 - 1 && [\text{Using } \log_a m^n = n\log_a m] \\
 &= a + 3b - 1 && [\text{From 1}]
 \end{aligned}$$

$$\begin{aligned}
 \text{(v) } \log 60 &= \log (10 \times 3 \times 2) \\
 &= \log 10 + \log 3 + \log 2 && [\text{Using } \log_a lmn = \log_a l + \log_a m + \log_a n] \\
 &= 1 + b + a && [\text{From 1}]
 \end{aligned}$$

$$\begin{aligned}
 \text{(vi) } \log 3\frac{1}{8} &= \log 25/8 \\
 &= \log 5^2/2^3 \\
 &= \log 5^2 - \log 2^3 && [\text{Using } \log_a m/n = \log_a m - \log_a n] \\
 &= 2\log 5 - 3\log 2 && [\text{Using } \log_a m^n = n\log_a m] \\
 &= 2\log 10/2 - 3\log 2 \\
 &= 2(\log 10 - \log 2) - 3\log 2 && [\text{Using } \log_a m/n = \log_a m - \log_a n] \\
 &= 2\log 10 - 2\log 2 - 3\log 2 && [\text{From 1}] \\
 &= 2(1) - 2a - 3a \\
 &= 2 - 5a
 \end{aligned}$$

**12. If  $\log 2 = 0.3010$  and  $\log 3 = 0.4771$ ; find the value of:**

**(i)  $\log 12$**

**(ii)  $\log 1.2$**

**(iii)  $\log 3.6$**

**(iv)  $\log 15$**

**(v)  $\log 25$**

**(vi)  $2/3 \log 8$**

**Solution:**

Given,  $\log 2 = 0.3010$  and  $\log 3 = 0.4771$

$$\begin{aligned}
 \text{(i) } \log 12 &= \log (4 \times 3) \\
 &= \log 4 + \log 3 && [\text{Using } \log_a mn = \log_a m + \log_a n] \\
 &= \log 2^2 + \log 3 \\
 &= 2\log 2 + \log 3 && [\text{Using } \log_a m^n = n\log_a m] \\
 &= 2 \times 0.3010 + 0.4771 \\
 &= 1.0791
 \end{aligned}$$

$$\begin{aligned}
 \text{(ii) } \log 1.2 &= \log 12/10 \\
 &= \log 12 - \log 10 && [\text{Using } \log_a m/n = \log_a m - \log_a n] \\
 &= \log (4 \times 3) - \log 10
 \end{aligned}$$

$$\begin{aligned}
 &= \log 4 + \log 3 - \log 10 \\
 &= \log 2^2 + \log 3 - \log 10 \\
 &= 2\log 2 + \log 3 - \log 10 \\
 &= 2 \times 0.3010 + 0.4771 - 1 \\
 &= 0.6020 + 0.4771 - 1 \\
 &= 1.0791 - 1 \\
 &= 0.0791
 \end{aligned}$$

[Using  $\log_a mn = \log_a m + \log_a n$ ]

[Using  $\log_a m^n = n\log_a m$ ]  
[As  $\log 10 = 1$ ]

(iii)  $\log 3.6 = \log 36/10$

$$\begin{aligned}
 &= \log 36 - \log 10 \\
 &= \log (2 \times 2 \times 3 \times 3) - 1 \\
 &= \log (2^2 \times 3^2) - 1 \\
 &= \log 2^2 + \log 3^2 - 1 \\
 &= 2\log 2 + 2\log 3 - 1 \\
 &= 2 \times 0.3010 + 2 \times 0.4771 - 1 \\
 &= 0.6020 + 0.9542 - 1 \\
 &= 1.5562 - 1 \\
 &= 0.5562
 \end{aligned}$$

[Using  $\log_a m/n = \log_a m - \log_a n$ ]  
[As  $\log 10 = 1$ ]

[Using  $\log_a mn = \log_a m + \log_a n$ ]  
[Using  $\log_a m^n = n\log_a m$ ]

(iv)  $\log 15 = \log (15/10 \times 10)$

$$\begin{aligned}
 &= \log 15/10 + \log 10 \\
 &= \log 3/2 + 1 \\
 &= \log 3 - \log 2 + 1 \\
 &= 0.4771 - 0.3010 + 1 \\
 &= 1.1761
 \end{aligned}$$

[Using  $\log_a mn = \log_a m + \log_a n$ ]  
[As  $\log 10 = 1$ ]

[Using  $\log_a m/n = \log_a m - \log_a n$ ]

(v)  $\log 25 = \log (25/4 \times 4)$

$$\begin{aligned}
 &= \log 100/4 \\
 &= \log 100 - \log 4 \\
 &= \log 10^2 - \log 2^2 \\
 &= 2\log 10 - 2\log 2 \\
 &= (2 \times 1) - (2 \times 0.3010) \\
 &= 2 - 0.6020 \\
 &= 1.398
 \end{aligned}$$

[Using  $\log_a m/n = \log_a m - \log_a n$ ]

[Using  $\log_a m^n = n\log_a m$ ]

**13. Given  $2 \log_{10} x + 1 = \log_{10} 250$ , find:**

**(i)  $x$**

**(ii)  $\log_{10} 2x$**

**Solution:**

(i) Given equation,  $2\log_{10} x + 1 = \log_{10} 250$

$$\log_{10} x^2 + \log_{10} 10 = \log_{10} 250$$

$$\log_{10} 10x^2 = \log_{10} 250$$

Removing log on both sides, we have

$$10x^2 = 250$$

$$x^2 = 25$$

[Using  $n\log_a m = \log_a m^n$  and  $\log_{10} 10 = 1$ ]

[Using  $\log_a m + \log_a n = \log_a mn$ ]

$$x = \pm 5$$

As  $x$  cannot be a negative value,  $x = -5$  is not possible

Hence,  $x = 5$

(ii) Now, from (i) we have  $x = 5$

So,

$$\begin{aligned}\log_{10} 2x &= \log_{10} 2(5) \\ &= \log_{10} 10 \\ &= 1\end{aligned}$$

**14. Given  $3\log x + \frac{1}{2}\log y = 2$ , express  $y$  in term of  $x$ .**

**Solution:**

We have,  $3\log x + \frac{1}{2}\log y = 2$

$$\log x^3 + \log y^{1/2} = 2$$

[Using  $\log_a m + \log_a n = \log_a mn$ ]

$$\log x^3 y^{1/2} = 2$$

Removing logarithm, we get

$$x^3 y^{1/2} = 10^2$$

$$y^{1/2} = 100/x^3$$

On squaring on both sides, we get

$$y = 10000/x^6$$

$$y = 10000x^{-6}$$

**15. If  $x = (100)^a$ ,  $y = (10000)^b$  and  $z = (10)^c$ , find  $\log 10\sqrt{y}/x^2z^3$  in terms of  $a$ ,  $b$  and  $c$ .**

**Solution:**

We have,

$$x = (100)^a, y = (10000)^b \text{ and } z = (10)^c$$

So,

$$\log x = a \log 100, \log y = b \log 10000 \text{ and } \log z = c \log 10$$

$$\Rightarrow \log x = a \log 10^2, \log y = b \log 10^4 \text{ and } \log z = c \log 10$$

$$\Rightarrow \log x = 2a \log 10, \log y = 4b \log 10 \text{ and } \log z = c \log 10$$

$$\Rightarrow \log x = 2a, \log y = 4b \text{ and } \log z = c \dots (i)$$

Now,

$$\log 10\sqrt{y}/x^2z^3 = \log 10\sqrt{y} - \log x^2z^3$$

[Using  $\log_a m/n = \log_a m - \log_a n$ ]

$$= (\log 10 + \log \sqrt{y}) - (\log x^2 + \log z^3)$$

[Using  $\log_a mn = \log_a m + \log_a n$ ]

$$= 1 + \log y^{1/2} - \log x^2 - \log z^3$$

$$= 1 + \frac{1}{2}\log y - 2\log x - 3\log z$$

[Using  $\log_a m^n = n\log_a m$ ]

$$= 1 + \frac{1}{2}(4b) - 2(2a) - 3c \dots \text{ [Using (i)]}$$

$$= 1 + 2b - 4a - 3c$$

**16. If  $3(\log 5 - \log 3) - (\log 5 - 2\log 6) = 2 - \log x$ , find  $x$ .**

**Solution:**

We have,

$$3(\log 5 - \log 3) - (\log 5 - 2\log 6) = 2 - \log x$$

**Concise Selina Solutions for Class 9 Maths Chapter 8 -  
Logarithms**

---

$$3\log 5 - 3\log 3 - \log 5 + 2\log 6 = 2 - \log x$$

$$3\log 5 - 3\log 3 - \log 5 + 2\log (3 \times 2) = 2 - \log x$$

$$2\log 5 - 3\log 3 + 2(\log 3 + \log 2) = 2 - \log x$$

[Using  $\log_a mn = \log_a m + \log_a n$ ]

$$2\log 5 - \log 3 + 2\log 3 + 2\log 2 = 2 - \log x$$

$$2\log 5 - \log 3 + 2\log 2 = 2 - \log x$$

$$2\log 5 - \log 3 + 2\log 2 + \log x = 2$$

$$\log 5^2 - \log 3 + \log 2^2 + \log x = 2$$

[Using  $n\log_a m = \log_a m^n$ ]

$$\log 25 - \log 3 + \log 4 + \log x = 2$$

$$\log (25 \times 4 \times x)/3 = 2$$

[Using  $\log_a m + \log_a n = \log_a mn$  &  $\log_a m - \log_a n = \log_a m/n$ ]

$$\log 100x/3 = 2$$

On removing logarithm,

$$100x/3 = 10^2$$

$$100x/3 = 100$$

Dividing by 100 on both sides, we have

$$x/3 = 1$$

Hence,  $x = 3$
