

Exercise 16(C)

1. In the given figure, the diagonals AC and BD intersect at point O. If $OB = OD$ and $AB \parallel DC$, show that:

- (i) Area (ΔDOC) = Area (ΔAOB).
- (ii) Area (ΔDCB) = Area (ΔACB).
- (iii) ABCD is a parallelogram.

Solution:

(i) Ratio of area of triangles with same vertex and bases along the same line is equal to the ratio of their respective bases.

So, we have

$$\text{Area of } \Delta DOC / \text{Area of } \Delta BOC = DO/BO = 1 \dots \text{(i)}$$

Similarly,

$$\text{Area of } \Delta DOA / \text{Area of } \Delta BOA = DO/BO = 1 \dots \text{(ii)}$$

We know that area of triangles on the same base and between same parallel lines are equal.

$$\text{Area of } \Delta ACD = \text{Area of } \Delta BCD$$

$$\text{Area of } \Delta AOD + \text{Area of } \Delta DOC = \text{Area of } \Delta DOC + \text{Area of } \Delta BOC$$

$$\Rightarrow \text{Area of } \Delta AOD = \text{Area of } \Delta BOC \dots \text{(iii)}$$

From (i), (ii) and (iii) we have

$$\text{Area } (\Delta DOC) = \text{Area } (\Delta AOB)$$

- Hence Proved.

(ii) Similarly, from 1, 2 and 3, we also have

$$\text{Area of } \Delta DCB = \text{Area of } \Delta DOC + \text{Area of } \Delta BOC = \text{Area of } \Delta AOB + \text{Area of } \Delta BOC = \text{Area of } \Delta ABC$$

$$\text{So, Area of } \Delta DCB = \text{Area of } \Delta ABC$$

- Hence Proved.

(iii) We know that area of triangles on the same base and between same parallel lines are equal.

Given: triangles are equal in area on the common base, so it indicates $AD \parallel BC$.

So, ABCD is a parallelogram.
- Hence Proved

2. The given figure shows a parallelogram ABCD with area 324 sq. cm. P is a point in AB such that AP: PB = 1:2 Find The area of ΔAPD .

Solution:

Ratio of area of triangles with the same vertex and bases along the same line is equal to the ratio of their respective bases.

So, we have

$$\text{Area of } \Delta APD / \text{Area of } \Delta BPD = AP/BP = 1/2$$

$$\text{Area of parallelogram ABCD} = 324 \text{ sq.cm}$$

Area of the triangles with the same base and between the same parallels are equal.

We know that area of the triangle is half the area of the parallelogram if they lie on the same base and between the parallels.

Therefore, we have,

$$\begin{aligned} \text{Area}(\Delta ABD) &= \frac{1}{2} \times \text{Area}(\text{||gm ABCD}) \\ &= 324/2 \\ &= 162 \text{ sq. cm} \end{aligned}$$

Also, from the diagram it is clear that

$$\text{Area}(\Delta ABD) = \text{Area}(\Delta APD) + \text{Area}(\Delta BPD)$$

$$162 = \text{Area}(\Delta APD) + 2 \times \text{Area}(\Delta APD)$$

$$162 = 3 \times \text{Area}(\Delta APD)$$

$$\text{Area}(\Delta APD) = 162/3$$

$$= 54 \text{ sq. cm}$$

(ii) Consider ΔAOP and ΔCOD

$$\angle AOP = \angle COD \text{ [Vertically opposite angles]}$$

$$\angle CDO = \angle APD \text{ [AB || DC and DP is the transversal, alternate interior angles are equal]}$$

Thus, $\Delta AOP \sim \Delta COD$ by AA similarity

Hence the corresponding sides are proportional.

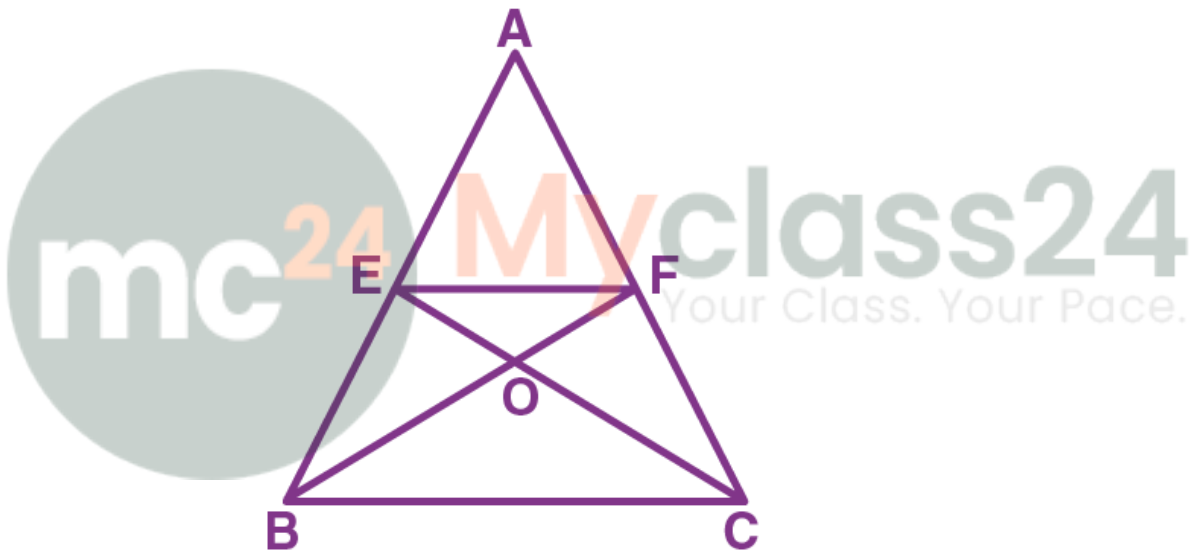

$$\begin{aligned} AP/CD &= OP/OD \\ &= AP/AB \\ &= AP/(AP+PB) \\ &= AP/3AP \\ &= 1/3 \end{aligned}$$

Therefore, OP: OD = 1: 3

3. In $\triangle ABC$, E and F are mid-points of sides AB and AC respectively. If BF and CE intersect each other at point O, prove that the $\triangle OBC$ and quadrilateral AEOF are equal in area.

Solution:

Given, E and F are the midpoints of the sides AB and AC
Let's consider the following figure.

Therefore, by midpoint theorem

We have, $EF \parallel BC$

Triangles BEF and CEF lie on the common base EF and between the parallels, EF and BC

Therefore, $Ar(\triangle BEF) = Ar(\triangle CEF)$

$$\Rightarrow Ar(\triangle BOE) + Ar(\triangle EOF) = Ar(\triangle EOF) + Ar(\triangle COF)$$

$$Ar(\triangle BOE) = Ar(\triangle COF)$$

Now, BF and CE are the medians of the triangle ABC

And, median of the triangle divide it into two equal areas of triangles.

$$\text{Thus, } Ar(\triangle ABF) = Ar(\triangle CBF)$$

Now, subtracting $Ar(\triangle BOE)$ on the both the sides, we get

$$Ar(\triangle ABF) - Ar(\triangle BOE) = Ar(\triangle CBF) - Ar(\triangle BOE)$$

$$\text{Since, } Ar(\triangle BOE) = Ar(\triangle COF)$$

$$\Rightarrow Ar(\triangle ABF) - Ar(\triangle BOE) = Ar(\triangle CBF) - Ar(\triangle COF)$$

$$Ar(\text{quad. AEOF}) = Ar(\triangle OBC)$$

- Hence proved

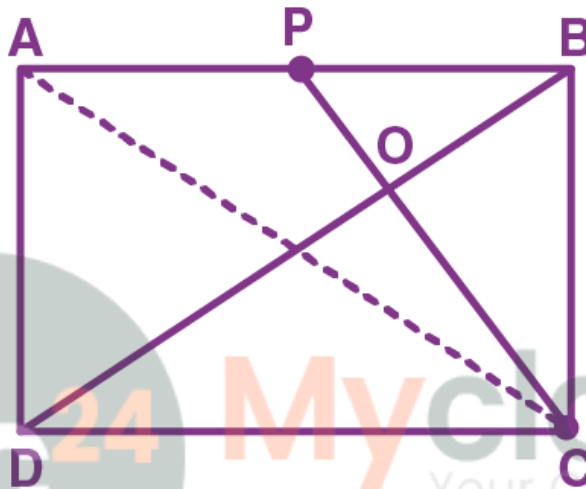

4. In parallelogram ABCD, P is mid-point of AB. CP and BD intersect each other at point O. If area of $\triangle POB = 40 \text{ cm}^2$, and $OP: OC = 1: 2$, find:

(i) Areas of $\triangle BOC$ and $\triangle PBC$

(ii) Areas of $\triangle ABC$ and parallelogram ABCD.

Solution:

(i) On joining AC, we have the following figure as below

Let's consider $\triangle POB$ and $\triangle COD$

$\angle POB = \angle DOC$ [Vertically opposite angles]

$\angle OPB = \angle ODC$ [Since, $AB \parallel DC$; CP and BD are the transversal, alternate interior angles are equal]

Therefore, $\triangle POB \sim \triangle COD$ by AA similarity criterion

As, P is the midpoint

$AP = BP$ and $AB = CD$, we have $CD = 2BP$

Therefore, we have

$$BP/CD = OP/OC = OB/OD = \frac{1}{2}$$

$$OP: OC = 1: 2$$

(ii) From (i), we have

$$BP/CD = OP/OC = OB/OD = \frac{1}{2},$$

Ratio between the areas of two similar triangles is equal to the ratio between the square of the corresponding sides

Here, $\triangle DOC$ and $\triangle POB$ are similar triangles.

Thus, we have

$$\text{Ar}(\triangle DOC)/\text{Ar}(\triangle POB) = DC^2/PB^2$$

$$\text{Ar}(\triangle DOC)/\text{Ar}(\triangle POB) = (2PB)^2/PB^2$$

$$\text{Ar}(\triangle DOC)/\text{Ar}(\triangle POB) = 4PB^2/PB^2$$

$$\text{Ar}(\triangle DOC)/\text{Ar}(\triangle POB) = 4$$

$$\text{Ar}(\triangle DOC) = 4 \times \text{Ar}(\triangle POB)$$

$$= 4 \times 40$$
$$= 160 \text{ cm}^2$$

$$\text{Now, consider } \text{Ar}(\triangle DBC) = \text{Ar}(\triangle DOC) + \text{Ar}(\triangle BOC)$$
$$= 160 + 80$$
$$= 240 \text{ cm}^2$$

Two triangles are equal in area if they are on the equal bases and between the same parallels

Therefore,

$$\text{Ar}(\triangle DBC) = \text{Ar}(\triangle ABC) = 240 \text{ cm}^2$$

We know that,

Median divides the triangle into areas of two equal triangles

Thus, CP is the median of the triangle ABC.

$$\text{Hence, } \text{Ar}(\triangle ABC) = 2 \times \text{Ar}(\triangle PBC)$$

$$\text{Ar}(\triangle PBC) = \text{Ar}(\triangle ABC)/2$$
$$= 240/2$$
$$= 120 \text{ cm}^2$$

(iii) From (ii), we have

$$\text{Ar}(\triangle ABC) = 2 \times \text{Ar}(\triangle PBC) = 240 \text{ cm}^2$$

Area of a triangle is half the area of the parallelogram

If both are on equal bases and between the same parallels

$$\text{Thus, } \text{Ar}(\triangle ABC) = \frac{1}{2} \text{Ar}(\text{||gm } ABCD)$$

$$\Rightarrow \text{Ar}(\text{||gm } ABCD) = 2 \text{Ar}(\triangle ABC)$$
$$= 2 \times 240$$
$$= 480 \text{ cm}^2$$

5. The medians of a triangle ABC intersect each other at point G. If one of its medians is AD, prove that:

(i) Area ($\triangle ABD$) = 3 \times Area ($\triangle BGD$)

(ii) Area ($\triangle ACD$) = 3 \times Area ($\triangle CGD$)

(iii) Area ($\triangle BGC$) = $\frac{1}{3}$ \times Area ($\triangle ABC$)

Solution:

The figure is as shown below

We know that, medians intersect at the centroid
Given that G is the point of intersection of medians
So, G is the centroid of the triangle ABC.
Now, the centroid divides the medians in the ratio 2:1

(i) We have, $AG:GD = 2:1$

So, $\text{Area}(\triangle AGB)/\text{Area}(\triangle BGD) = 2/1$

$\text{Area}(\triangle AGB) = 2\text{Area}(\triangle BGD)$

Now, from the figure, it is clearly seen that

$\text{Area}(\triangle ABD) = \text{Area}(\triangle AGB) + \text{Area}(\triangle BGD)$

$\text{Area}(\triangle ABD) = 2 \times \text{Area}(\triangle BGD) + \text{Area}(\triangle BGD)$

Thus, $\text{Area}(\triangle ABD) = 3 \times \text{Area}(\triangle BGD) \dots (1)$

(ii) Similarly, CG divides AD in the ratio 2:1

So, $\text{Area}(\triangle AGC) / \text{Area}(\triangle CGD) = 2/1$

$\text{Area}(\triangle AGC) = 2 \times \text{Area}(\triangle CGD)$

Now, from the figure, it is clearly seen that

$\text{Area}(\triangle ACD) = \text{Area}(\triangle AGC) + \text{Area}(\triangle CGD)$

$\text{Area}(\triangle ACD) = 2 \times \text{Area}(\triangle CGD) + \text{Area}(\triangle CGD)$

Thus, $\text{Area}(\triangle ACD) = 3 \times \text{Area}(\triangle CGD) \dots (2)$

(iii) Adding equation (1) and (2), we have

$\text{Area}(\triangle ABD) + \text{Area}(\triangle ACD) = 3\text{Area}(\triangle BGD) + 3\text{Area}(\triangle CGD)$

$\text{Area}(\triangle ABC) = 3 \times [\text{Area}(\triangle BGD) + \text{Area}(\triangle CGD)]$

$\text{Area}(\triangle ABC) = 3 \times \text{Area}(\triangle BGC)$

$\text{Area}(\triangle ABC)/3 = \text{Area}(\triangle BGC)$

Thus, $\text{Area}(\triangle BGC) = 1/3 \times \text{Area}(\triangle ABC)$

6. The perimeter of a triangle ABC is 37 cm and the ratio between the lengths of its altitudes be 6 : 5 : 4. Find the lengths of its sides.

Solution:

Let's consider the sides of $\triangle ABC$ to be x cm, y cm and $(37 - x - y)$ cm

Also, let the lengths of its altitudes be $6a$ cm, $5a$ cm and $4a$ cm

We know that,

Area of a triangle = $\frac{1}{2} \times \text{base} \times \text{altitude}$

$$\Rightarrow \frac{1}{2} \times 6a = \frac{1}{2} \times y \times 5a = \frac{1}{2} \times (37 - x - y) \times 4a$$

$$6x = 5y = 148 - 4x - 4y$$

$$6x = 5y \text{ and } 6x = 148 - 4x - 4y$$

$$6x - 5y = 0 \text{ and } 10x + 4y - 148 = 0$$

Now, by solving both the equations, we have

$$x = 10 \text{ cm and } y = 12 \text{ cm}$$

$$\text{And, } (37 - x - y) = 15 \text{ cm}$$

7. In parallelogram ABCD, E is a point in AB and DE meets diagonal AC at point F. If $DF:FE = 5:3$ and area of $\triangle ADF$ is 60 cm^2 ; find

(i) Area of $\triangle ADE$

(ii) If $AE:EB = 4:5$, find the area of $\triangle ADB$

(iii) Also, find area of parallelogram ABCD

Solution:

Triangles ADF and AFE have the same vertex A and their bases are on the same straight line DE

$$\text{Hence, } \text{Ar}(\triangle ADF)/\text{Ar}(\triangle AFE) = DF/FE$$

$$60/\text{Ar}(\triangle AFE) = 5/3$$

$$\begin{aligned} \text{Ar}(\triangle AFE) &= (60 \times 3)/5 \\ &= 36 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Now, } \text{Ar}(\triangle ADE) &= \text{Ar}(\triangle ADF) + \text{Ar}(\triangle AFE) \\ &= 60 \text{ cm}^2 + 36 \text{ cm}^2 \\ &= 96 \text{ cm}^2 \end{aligned}$$

$\triangle ADE$ and $\triangle EDB$ have their bases are on the same straight line AB

$$\therefore \text{Ar}(\triangle ADE)/\text{Ar}(\triangle EDB) = AE/EB$$

$$96/\text{Ar}(\triangle EDB) = 4/5$$

$$\begin{aligned} \text{Ar}(\triangle EDB) &= (96 \times 5)/4 \\ &= 120\text{cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Now, Ar}(\triangle ADB) &= \text{Ar}(\triangle ADE) + \text{Ar}(\triangle EDB) \\ &= 96 \text{ cm}^2 + 120 \text{ cm}^2 \\ &= 216 \text{ cm}^2 \end{aligned}$$

Now,

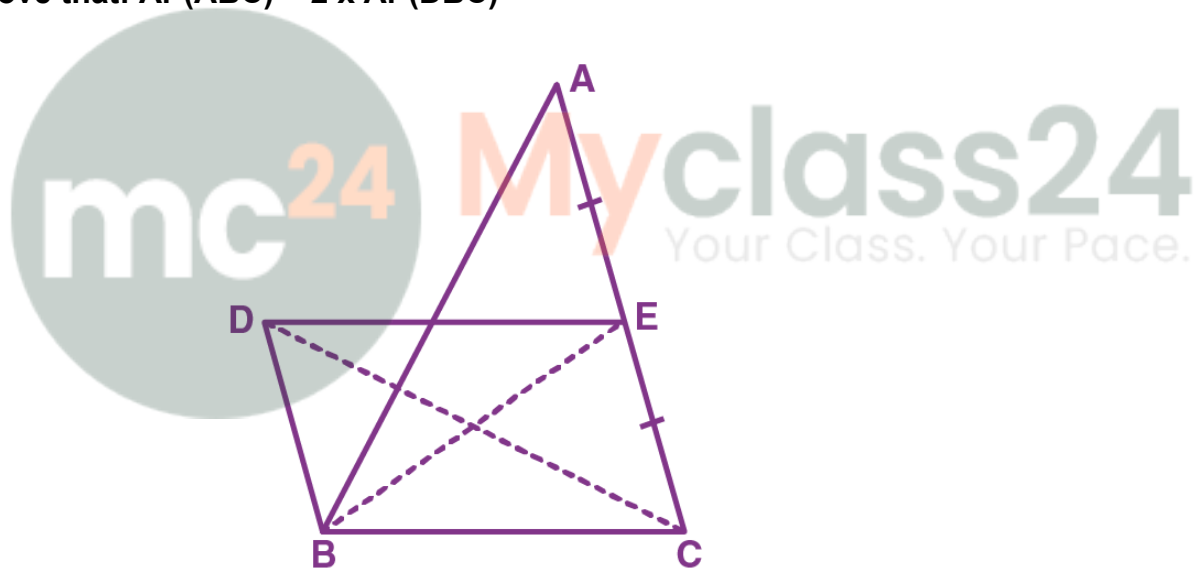

$\triangle ADB$ and $\parallel^m ABCD$ are on the same base AB and between the same parallels AB and DC

$$\therefore \text{Ar}(\triangle ADB) = \frac{1}{2} \text{Ar}(\parallel^m ABCD)$$

$$216 = \frac{1}{2} \text{Ar}(\parallel^m ABCD)$$

$$\begin{aligned} \text{Thus, Ar}(\parallel^m ABCD) &= 2 \times 216 \\ &= 432 \text{ cm}^2 \end{aligned}$$

**8. In the following figure, BD is parallel to CA, E is mid-point of CA and $BD = \frac{1}{2} CA$.
Prove that: $\text{Ar}(\triangle ABC) = 2 \times \text{Ar}(\triangle DBC)$**

Solution:

Here, BCED is a parallelogram, since $BD = CE$ and $BD \parallel CE$.

Now,

$\text{Ar}(\triangle DBC) = \text{Ar}(\triangle EBC)$... (i) [Since they have the same base and area between the same parallels]

In $\triangle ABC$, we have

BE as the median

$$\text{So, Ar}(\triangle EBC) = \frac{1}{2} [\text{Ar}(\triangle EBC) + \text{Ar}(\triangle ABE)] = \frac{1}{2} \text{Ar}(\triangle ABC)$$

$$\Rightarrow \text{Ar}(\triangle ABC) = 2\text{Ar}(\triangle EBC)$$

$$\text{Therefore, Ar}(\triangle ABC) = 2\text{Ar}(\triangle DBC) \quad [\text{From (i)}]$$

9. In the following figure, OAB is a triangle and $AB \parallel DC$.

If the area of $\triangle CAD = 140 \text{ cm}^2$ and the area of $\triangle ODC = 172 \text{ cm}^2$, find

- (i) the area of $\triangle DBC$
- (ii) the area of $\triangle OAC$
- (iii) the area of $\triangle ODB$.

Solution:

Given: $\triangle CAD = 140 \text{ cm}^2$, $\triangle ODC = 172 \text{ cm}^2$ and $AB \parallel CD$

As triangles DBC and CAD have the same base CD and between the same parallel lines
Hence,

$$\text{Ar}(\triangle DBC) = \text{Ar}(\triangle CAD) = 140 \text{ cm}^2$$

$$\begin{aligned} \text{Ar}(\triangle OAC) &= \text{Ar}(\triangle CAD) + \text{Ar}(\triangle ODC) \\ &= 140 \text{ cm}^2 + 172 \text{ cm}^2 \\ &= 312 \text{ cm}^2 \end{aligned}$$

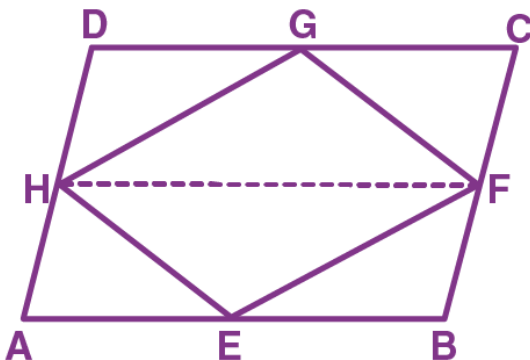

$$\begin{aligned} \text{Ar}(\triangle ODB) &= \text{Ar}(\triangle DBC) + \text{Ar}(\triangle ODC) \\ &= 140 \text{ cm}^2 + 172 \text{ cm}^2 \\ &= 312 \text{ cm}^2 \end{aligned}$$

Your Class. Your Pace.

10. E, F, G and H are the mid- points of the sides of a parallelogram ABCD. Show that area of quadrilateral EFGH is half of the area of parallelogram ABCD.

Solution:

Let's join HF.

Since H and F are mid-points of AD and BC respectively, we have

$$AH = \frac{1}{2} AD \text{ and } BF = \frac{1}{2} BC$$

Now, ABCD is a parallelogram

$$AD = BC \text{ and } AD \parallel BC$$

$$\Rightarrow \frac{1}{2} AD = \frac{1}{2} BC \text{ and } AD \parallel BC$$

So, AH = BF and AH \parallel BF

Thus, ABFH is a parallelogram

Now,

Since parallelogram FHAB and $\triangle FHE$ are on the same base FH and between the same parallels HF and AB, we have

$$Ar(\triangle FHE) = \frac{1}{2} Ar(\parallel^m FHAB) \dots(i)$$

Similarly,

$$Ar(\triangle FHG) = \frac{1}{2} Ar(\parallel^m FHDC) \dots(ii)$$

Adding (i) and (ii), we get

$$Ar(\triangle FHE) + Ar(\triangle FHG) = \frac{1}{2} Ar(\parallel^m FHAB) + \frac{1}{2} Ar(\parallel^m FHDC)$$

$$Ar(EFGH) = \frac{1}{2} [Ar(\parallel^m FHAB) + \frac{1}{2} Ar(\parallel^m FHDC)]$$

$$\therefore Ar(EFGH) = \frac{1}{2} Ar(\parallel^m ABCD)$$

11. ABCD is a trapezium with AB parallel to DC. A line parallel to AC intersects AB at X and BC at Y. Prove that area of $\triangle ADX$ = area of $\triangle ACY$.

Solution:

Let's join CX, DX and AY.

Now, triangles ADX and ACX are on the same base AX and between the parallels AB and DC.

$$\therefore Ar(\triangle ADX) = Ar(\triangle ACX) \dots(i)$$

Also, triangles ACX and ACY are on the same base AC and between the parallels AC and XY.

$$\therefore Ar(\triangle ACX) = Ar(\triangle ACY) \dots(ii)$$

From (i) and (ii), we get

$$Ar(\triangle ADX) = Ar(\triangle ACY)$$

- Hence proved
