

EXERCISE 3C

Reduce to a single fraction:

(i) $1/2 + 2/3$

(ii) $3/5 - 1/10$

(iii) $2/3 - 1/6$

(iv) $1\ 1/3 + 2\ 1/4$

(v) $1/4 + 5/6 - 1/12$

(vi) $2/3 - 3/5 + 3 - 1/5$

(vii) $2/3 - 1/5 + 1/10$

(viii) $2\ 1/2 + 2\ 1/3 - 1\ 1/4$

(ix) $2\ 5/8 - 2\ 1/6 + 4\ 3/4$

Solution:

(i) $1/2 + 2/3$

Here the LCM of 2 and 3 is 6

$$= (1 \times 3)/(2 \times 3) + (2 \times 2)/(3 \times 2)$$

By further calculation

$$= 3/6 + 4/6$$

$$= (3 + 4)/6$$

So we get

$$= 7/6$$

$$= 1\ 1/6$$

(ii) $3/5 - 1/10$

Here the LCM of 5 and 10 is 10

$$= (3 \times 2)/(5 \times 2) - 1/10$$

By further calculation

$$= 6/10 - 1/10$$

So we get

$$= (6 - 1)/10$$

$$= 5/10$$

$$= 1/2$$

(iii) $2/3 - 1/6$

Here the LCM of 3 and 6 is 6

$$= (2 \times 2)/(3 \times 2) - 1/6$$

By further calculation

$$= 4/6 - 1/6$$

So we get

$$= (4 - 1)/6$$

$$= 3/6$$

$$= 1/2$$

(iv) $1\ 1/3 + 2\ 1/4$

It can be written as

$$= 4/3 + 9/4$$

Here LCM of 3 and 4 is 12

$$= (4 \times 4)/(3 \times 4) + (9 \times 3)/(4 \times 3)$$

By further calculation

$$= 16/12 + 27/12$$

So we get

$$= (16 + 27)/12$$

$$= 43/12$$

$$= 3 \frac{7}{12}$$

(v) $1/4 + 5/6 - 1/12$

Here LCM of 4, 6 and 12 is 12

$$= (1 \times 3)/(4 \times 3) + (5 \times 2)/(6 \times 2) - 1/12$$

By further calculation

$$= 3/12 + 10/12 - 1/12$$

So we get

$$= (3 + 10 - 1)/12$$

$$= 12/12$$

$$= 1$$

(vi) $2/3 - 3/5 + 3 - 1/5$

Here LCM of 3 and 5 is 15

$$= (2 \times 5)/(3 \times 5) - (3 \times 3)/(5 \times 3) + (3 \times 15)/15 - (1 \times 3)/(5 \times 3)$$

By further calculation

$$= 10/15 - 9/15 + 45/15 - 3/15$$

So we get

$$= (10 - 9 + 45 - 3)/15$$

$$= (55 - 12)/15$$

$$= 43/15$$

$$= 2 \frac{13}{15}$$

(vii) $2/3 - 1/5 + 1/10$

Here the LCM of 3, 5 and 10 is 30

$$= (2 \times 10)/(3 \times 10) - (1 \times 6)/(5 \times 6) + (1 \times 3)/(10 \times 3)$$

By further calculation

$$= 20/30 - 6/30 + 3/30$$

So we get

$$= (20 - 6 + 3)/30$$

$$= (23 - 6)/30$$

$$= 17/30$$

(viii) $2 \frac{1}{2} + 2 \frac{1}{3} - 1 \frac{1}{4}$

It can be written as

$$= 5/2 + 7/3 - 5/4$$

Here the LCM of 2, 3 and 4 is 12

$$= (5 \times 6)/(2 \times 6) + (7 \times 4)/(3 \times 4) - (5 \times 3)/(4 \times 3)$$

By further calculation

$$= 30/12 + 28/12 - 15/12$$

So we get

$$= (30 + 28 - 15)/12$$

$$= (58 - 15)/12$$

$$= 43/12$$

$$= 3 \frac{7}{12}$$

(ix) $2\frac{5}{8} - 2\frac{1}{6} + 4\frac{3}{4}$

It can be written as

$$= \frac{21}{8} - \frac{13}{6} + \frac{19}{4}$$

Here the LCM of 8, 6 and 4 is 24

$$= \frac{(21 \times 3)}{(8 \times 3)} - \frac{(13 \times 4)}{(6 \times 4)} + \frac{(19 \times 6)}{(4 \times 6)}$$

By further calculation

$$= \frac{63}{24} - \frac{52}{24} + \frac{114}{24}$$

So we get

$$= \frac{(63 - 52 + 114)}{24}$$

$$= \frac{(177 - 52)}{24}$$

$$= \frac{125}{24}$$

$$= 5\frac{5}{24}$$

2. Simplify:

(i) $\frac{3}{4} \times 6$

(ii) $\frac{2}{3} \times 15$

(iii) $\frac{3}{4} \times \frac{1}{2}$

(iv) $\frac{9}{12} \times \frac{4}{7}$

(v) $45 \times 2\frac{1}{3}$

(vi) $36 \times 3\frac{1}{4}$

(vii) $2 \div \frac{1}{3}$

(viii) $3 \div \frac{2}{5}$

(ix) $1 \div \frac{3}{5}$

(x) $\frac{1}{3} \div \frac{1}{4}$

(xi) $-\frac{5}{8} \div \frac{3}{4}$

(xii) $3\frac{3}{7} \div 1\frac{1}{14}$

(xiii) $3\frac{3}{4} \times 1\frac{1}{5} \times \frac{20}{21}$

Solution:

(i) $\frac{3}{4} \times 6$

It can be written as

$$= \frac{3}{4} \times \frac{6}{1}$$

$$= \frac{(3 \times 6)}{(4 \times 1)}$$

So we get

$$= \frac{18}{4}$$

HCF of 18 and 4 is 2

Dividing both numerator and denominator by 2

$$= \frac{(18 \div 2)}{(4 \div 2)}$$

$$= \frac{9}{2}$$

$$= 4\frac{1}{2}$$

(ii) $\frac{2}{3} \times 15$

It can be written as

$$= \frac{2}{3} \times \frac{15}{1}$$

$$= \frac{(2 \times 15)}{(3 \times 1)}$$

So we get

$$= \frac{30}{3}$$

$$= 10$$

(iii) $\frac{3}{4} \times \frac{1}{2}$

It can be written as
 $= (3 \times 1) / (4 \times 2)$
 $= 3/8$

(iv) $9/12 \times 4/7$
It can be written as
 $= (9 \times 4) / (12 \times 7)$
So we get
 $= 36/84$

Here the HCF of 36 and 84 is 12
Dividing both numerator and denominator by 12
 $= (36 \div 12) / (84 \div 12)$
 $= 3/7$

(v) $45 \times 2 \frac{1}{3}$
It can be written as
 $= 45/1 \times 7/3$
 $= (45 \times 7) / (1 \times 3)$
So we get
 $= 315/3$
 $= 105$

(vi) $36 \times 3 \frac{1}{4}$
It can be written as
 $= 36/1 \times 13/4$
 $= (36 \times 13) / (4 \times 1)$
So we get
 $= 468/4$
 $= 117$

(vii) $2 \div 1/3$
It can be written as
 $= 2/1 \times 3/1$
 $= (2 \times 3) / (1 \times 1)$
So we get
 $= 6/1$
 $= 6$

(viii) $3 \div 2/5$
It can be written as
 $= 3/1 \times 5/2$
 $= (3 \times 5) / (1 \times 2)$
So we get
 $= 15/2$
 $= 7 \frac{1}{2}$

(ix) $1 \div 3/5$
It can be written as
 $= 1 \times 5/3$
 $= (1 \times 5) / 3$

Myclass24
Your Class. Your Pace.

So we get
 $= \frac{5}{3}$
 $= 1 \frac{2}{3}$

(x) $\frac{1}{3} \div \frac{1}{4}$
It can be written as
 $= \frac{1}{3} \times \frac{4}{1}$
 $= \frac{(1 \times 4)}{(3 \times 1)}$
So we get
 $= \frac{4}{3}$
 $= 1 \frac{1}{3}$

(xi) $-\frac{5}{8} \div \frac{3}{4}$
It can be written as
 $= -\frac{5}{8} \times \frac{4}{3}$
 $= \frac{(-5 \times 4)}{(8 \times 3)}$
So we get
 $= -\frac{20}{24}$
Here the HCF of 20 and 24 is 4
So by dividing both numerator and denominator by 4
 $= \frac{(-20 \div 4)}{(24 \div 4)}$
 $= -\frac{5}{6}$

(xii) $3 \frac{3}{7} \div 1 \frac{1}{14}$
It can be written as
 $= \frac{24}{7} \times \frac{14}{15}$
 $= \frac{(24 \times 14)}{(7 \times 15)}$
So we get
 $= \frac{336}{105}$
Here the HCF of 336 and 105 is 21
So by dividing both numerator and denominator by 21
 $= \frac{(336 \div 21)}{(105 \div 21)}$
 $= \frac{16}{5}$
 $= 3 \frac{1}{5}$

(xiii) $3 \frac{3}{4} \times 1 \frac{1}{5} \times \frac{20}{21}$
It can be written as
 $= \frac{15}{4} \times \frac{6}{5} \times \frac{20}{21}$
 $= \frac{(15 \times 6 \times 20)}{(4 \times 5 \times 21)}$
So we get
 $= \frac{1800}{420}$
Here the HCF of 1800 and 420 is 60
So by dividing both numerator and denominator by 60
 $= \frac{(1800 \div 60)}{(420 \div 60)}$
 $= \frac{30}{7}$
 $= 4 \frac{2}{7}$

3. Subtract:

(i) 2 from $\frac{2}{3}$

(ii) $\frac{1}{8}$ from $\frac{5}{8}$

(iii) $-2/5$ and $2/5$

(iv) $-3/7$ from $3/7$

(v) 0 from $-4/5$

(vi) $2/9$ from $4/5$

(vii) $-4/7$ from $-6/11$

Solution:

(i) 2 from $2/3$

It can be written as

$$= 2/3 - 2/1$$

LCM of 3 and 1 is 3

$$= 2/3 - (2 \times 3)/3$$

$$= 2/3 - 6/3$$

So we get

$$= (2 - 6)/3$$

$$= -4/3$$

$$= -1 \frac{1}{3}$$

(ii) $1/8$ from $5/8$

It can be written as

$$= 5/8 - 1/8$$

$$= (5 - 1)/8$$

So we get

$$= 4/8$$

$$= 1/2$$

(iii) $-2/5$ and $2/5$

It can be written as

$$= 2/5 - (-2/5)$$

$$= 2/5 + 2/5$$

So we get

$$= (2 + 2)/5$$

$$= 4/5$$

(iv) $-3/7$ from $3/7$

It can be written as

$$= 3/7 - (-3/7)$$

$$= 3/7 + 3/7$$

So we get

$$= (3 + 3)/7$$

$$= 6/7$$

(v) 0 from $-4/5$

It can be written as

$$= -4/5 - 0$$

$$= -4/5$$

(vi) $2/9$ from $4/5$

It can be written as

$$= 4/5 - 2/9$$

mc24

Myclass24
Your Class. Your Pace.

$$\begin{aligned} &\text{LCM of 5 and 9 is 45} \\ &= (4 \times 9) / (5 \times 9) - (2 \times 5) / (9 \times 5) \\ &\text{By further calculation} \\ &= 36/45 - 10/45 \\ &= (36 - 10) / 45 \\ &= 26/45 \end{aligned}$$

$$\begin{aligned} &(\text{vii}) -4/7 \text{ from } -6/11 \\ &\text{It can be written as} \\ &= -6/11 - (-4/7) \\ &= -6/11 + 4/7 \\ &\text{Here LCM of 7 and 11 is 77} \\ &= (-6 \times 7) / (11 \times 7) + (4 \times 11) / (7 \times 11) \\ &\text{By further calculation} \\ &= -42/77 + 44/77 \\ &\text{So we get} \\ &= (-42 + 44) / 77 \\ &= 2/77 \end{aligned}$$

4. Find the value of:

- (i) $\frac{1}{2}$ and 10 kg
- (ii) $\frac{3}{5}$ of 1 hour
- (iii) $\frac{4}{7}$ of $2\frac{1}{3}$ kg
- (iv) $3\frac{1}{2}$ times of 2 metre
- (v) $\frac{1}{2}$ of $2\frac{2}{3}$
- (vi) $\frac{5}{11}$ of $\frac{4}{5}$ of 22 kg

Solution:

$$\begin{aligned} &(\text{i}) \frac{1}{2} \text{ and } 10 \text{ kg} \\ &\text{It can be written as} \\ &= (\frac{1}{2} \times 10) \text{ kg} \\ &= 5 \text{ kg} \end{aligned}$$

$$\begin{aligned} &(\text{ii}) \frac{3}{5} \text{ of } 1 \text{ hour} \\ &\text{It can be written as} \\ &= (\frac{3}{5} \times 60) \text{ minutes} \\ &= 3 \times 12 \\ &= 36 \text{ minutes} \end{aligned}$$

$$\begin{aligned} &(\text{iii}) \frac{4}{7} \text{ of } 2\frac{1}{3} \text{ kg} \\ &\text{It can be written as} \\ &= (\frac{4}{7} \times \frac{7}{3}) \text{ kg} \\ &\text{So we get} \\ &= \frac{4}{3} \text{ kg} \\ &= 1\frac{1}{3} \text{ kg} \end{aligned}$$

$$\begin{aligned} &(\text{iv}) 3\frac{1}{2} \text{ times of } 2 \text{ metre} \\ &\text{It can be written as} \\ &= (\frac{7}{2} \times 2) \text{ metres} \\ &= 7 \text{ metres} \end{aligned}$$

(v) $1/2$ of $2\frac{2}{3}$
It can be written as
 $= 1/2 \times 8/3$
So we get
 $= 4/3$
 $= 1\frac{1}{3}$

(vi) $5/11$ of $4/5$ of 22 kg
It can be written as
 $= (5/11 \times 4/5 \times 22/1)$ kg
So we get
 $= 4 \times 2$
 $= 8$ kg

5. Simplify and reduce to a simple fraction:

(i) $3/3\frac{3}{4}$

(ii) $3/5/7$

(iii) $3/5/7$

(iv) $2\frac{1}{5}/1\frac{1}{10}$

(v) $2/5$ of $6/11 \times 1\frac{1}{4}$

(vi) $2\frac{1}{4} \div 1/7 \times 1/3$

(vii) $1/3 \times 4\frac{2}{3} \div 3\frac{1}{2} \times 1/2$

(viii) $2/3 \times 1\frac{1}{4} \div 3/7$ of $2\frac{5}{8}$

(ix) $0 \div 8/11$

(x) $4/5 \div 7/15$ of $8/9$

(xi) $4/5 \div 7/15 \times 8/9$

(xii) $4/5$ of $7/15 \div 8/9$

(xiii) $1/2$ of $3/4 \times 1/2 \div 2/3$

Solution:

(i) $3/3\frac{3}{4}$
It can be written as
 $= 3 / 15/4$
So we get
 $= (3 \times 4) / 15$
 $= 4/5$

(ii) $3/5/7$
It can be written as
 $= 3/5 \times 1/7$
 $= 3/35$

(iii) $3/5/7$
It can be written as
 $= 3 \times 7/5$
So we get
 $= 21/5$
 $= 4\frac{1}{5}$

(iv) $2\frac{1}{5}/1\frac{1}{10}$

It can be written as
 $= 11/5 \div 11/10$
So we get
 $= 11/5 \times 10/11$
 $= 2$

(v) $2/5$ of $6/11 \times 1 \frac{1}{4}$
It can be written as
 $= 2/5$ of $6/11 \times 5/4$
So we get
 $= 12/55 \times 5/4$
 $= 3/11$

(vi) $2 \frac{1}{4} \div 1/7 \times 1/3$
It can be written as
 $= 9/4 \div 1/7 \times 1/3$
So we get
 $= 9/4 \times 7/1 \times 1/3$
 $= 21/4$
 $= 5 \frac{1}{4}$

(vii) $1/3 \times 4 \frac{2}{3} \div 3 \frac{1}{2} \times 1/2$
It can be written as
 $= 1/3 \times 14/3 \div 7/2 \times 1/2$
So we get
 $= 1/3 \times 14/3 \times 2/7 \times 1/2$
 $= 2/9$

(viii) $2/3 \times 1 \frac{1}{4} \div 3/7$ of $2 \frac{5}{8}$
It can be written as
 $= 2/3 \times 5/4 \div 3/7$ of $21/8$
So we get
 $= 2/3 \times 5/4 \div 9/8$
Here
 $= 2/3 \times 5/4 \times 8/9$
 $= 20/27$

(ix) $0 \div 8/11$
It can be written as
 $= 0 \times 11/8$
 $= 0$

(x) $4/5 \div 7/15$ of $8/9$
From BODMAS rule
 $= 4/5 \div 156/135$
So we get
 $= 4/5 \times 135/56$
 $= 27/14$
 $= 1 \frac{13}{14}$

(xi) $4/5 \div 7/15 \times 8/9$

It can be written as

$$= 4/5 \times 15/7 \times 8/9$$

So we get

$$= 32/21$$

$$= 1 \frac{11}{21}$$

(xii) $4/5$ of $7/15 \div 8/9$

From BODMAS rule

$$= 28/75 \div 8/9$$

So we get

$$= 28/75 \times 9/8$$

By further calculation

$$= (7 \times 3) / (25 \times 2)$$

$$= 21/50$$

(xiii) $1/2$ of $3/4 \times 1/2 \div 2/3$

From BODMAS rule

$$= 3/8 \times 1/2 \div 2/3$$

So we get

$$= 3/8 \times 1/2 \times 3/2$$

$$= 9/32$$

6. A bought $3 \frac{3}{4}$ kg of wheat and $2 \frac{1}{2}$ kg of rice. Find the total weight wheat and rice bought.

Solution:

It is given that

$$\text{Weight of wheat} = 3 \frac{3}{4} \text{ kg} = 15/4 \text{ kg}$$

$$\text{Weight of rice} = 2 \frac{1}{2} \text{ kg} = 5/2 \text{ kg}$$

$$\text{So the total weight of wheat and rice} = 15/4 + 5/2$$

Here the LCM of 4 and 2 is 4

$$= (15 \times 1) / (4 \times 1) + (5 \times 2) / (2 \times 2)$$

So we get

$$= (15 + 10) / 4$$

$$= 25/4 \text{ kg}$$

$$= 6 \frac{1}{4} \text{ kg}$$

7. Which is greater, $3/5$ or $7/10$ and by how much?

Solution:

By cross multiplying

$$3 \times 10 = 30 \text{ and } 7 \times 5 = 35$$

Here 30 is smaller than 35

$$\text{So } 3/5 < 7/10$$

We know that difference between $7/10$ and $3/5$

$$= 7/10 - 3/5$$

LCM of 10 and 5 is 10

$$= (7 \times 1) / (10 \times 1) - (3 \times 2) / (5 \times 2)$$

So we get

$$= (7 - 6)/10$$
$$= 1/10$$

Therefore, $7/10$ is greater than $3/5$ by $1/10$.

8. What number should be added to $8 \frac{2}{3}$ to get $12 \frac{5}{6}$?

Solution:

To find the fraction we must subtract $8 \frac{2}{3}$ from $12 \frac{5}{6}$

So the required number = $12 \frac{5}{6} - 8 \frac{2}{3}$

It can be written as

$$= 77/6 - 26/3$$

Here the LCM of 3 and 6 is 6

$$= (77 \times 1)/(6 \times 1) - (26 \times 2)/(3 \times 2)$$

By further calculation

$$= (77 - 52)/6$$

$$= 25/6$$

$$= 4 \frac{1}{6}$$

9. What should be subtracted from $8 \frac{3}{4}$ to get $2 \frac{2}{3}$?

Solution:

Required number = $8 \frac{3}{4} - 2 \frac{2}{3}$

It can be written as

$$= 35/4 - 8/3$$

LCM of 4 and 3 is 12

$$= (35 \times 3)/(4 \times 3) - (8 \times 4)/(3 \times 4)$$

By further calculation

$$= (105 - 32)/12$$

$$= 73/12$$

$$= 6 \frac{1}{12}$$

10. A rectangular field is $16 \frac{1}{2}$ m long and $12 \frac{2}{5}$ m wide. Find the perimeter of the field.

Solution:

Dimensions of rectangular field are

Length = $16 \frac{1}{2}$ m

Breadth = $12 \frac{2}{5}$ m

So the perimeter = $2(l + b)$

Substituting the values

$$= 2 \times (16 \frac{1}{2} + 12 \frac{2}{5})$$

It can be written as

$$= 2 \times (33/2 + 62/5)$$

LCM of 2 and 5 is 10

$$= 2 \times [(33 \times 5)/(2 \times 5) + (62 \times 2)/(5 \times 2)]$$

By further calculation

$$= 2 \times [(165 + 124)/10]$$

So we get

$$= 2 \times 289/10$$

$$= 289/5 \text{ m}$$

$$= 57 \frac{4}{5} \text{ m}$$

11. Sugar costs ₹ 37 $\frac{1}{2}$ per kg. Find the cost of 8 $\frac{3}{4}$ kg sugar.

Solution:

It is given that

$$\text{Cost of 1 kg sugar} = ₹ 37 \frac{1}{2}$$

$$\text{So the cost of } 8 \frac{3}{4} \text{ kg sugar} = 37 \frac{1}{2} \times 8 \frac{3}{4}$$

It can be written as

$$= \frac{75}{2} \times \frac{35}{4}$$

$$= \frac{2625}{8}$$

$$= ₹ 328 \frac{1}{8}$$

12. A motor cycle runs 31 $\frac{1}{4}$ km consuming 1 litre of petrol. How much distance will it run consuming 1 $\frac{3}{5}$ litre of petrol?

Solution:

It is given that

$$\text{Distance covered consuming 1 litre petrol} = 31 \frac{1}{4} \text{ km} = \frac{125}{4} \text{ km}$$

$$\text{So the distance covered consuming } 1 \frac{3}{5} \text{ litre petrol} = \frac{125}{4} \times \frac{8}{5}$$

$$= \frac{1000}{20}$$

$$= 50 \text{ km}$$

13. A rectangular park has length = 23 $\frac{2}{5}$ m and breadth = 16 $\frac{2}{3}$ m. Find the area of the park.

Solution:

Dimensions of rectangular park are

$$\text{Length} = 23 \frac{2}{5} \text{ m} = \frac{117}{5} \text{ m}$$

$$\text{Breadth} = 16 \frac{2}{3} \text{ m} = \frac{50}{3} \text{ m}$$

So the area = $l \times b$

Substituting the values

$$= \frac{117}{5} \times \frac{50}{3}$$

$$= 39 \times 10$$

$$= 390 \text{ m}^2$$

14. Each of 40 identical boxes weighs 4 $\frac{4}{5}$ kg. Find the total weight of all the boxes.

Solution:

It is given that

$$\text{Weight of one box} = 4 \frac{4}{5} \text{ kg} = \frac{24}{5} \text{ kg}$$

$$\text{So the weight of 40 boxes} = 40 \times \frac{24}{5}$$

$$= 8 \times 24$$

$$= 192 \text{ kg}$$

15. Out of 24 kg of wheat, $\frac{5}{6}$ th of wheat is consumed. Find, how much wheat is still left?

Solution:

$$\text{Wheat available} = 24 \text{ kg}$$

$$\text{Wheat consumed} = \frac{5}{6} \text{th of } 24 \text{ kg}$$

$$= \frac{5}{6} \times 24$$

$$= 20\text{kg}$$

$$\text{So the remaining wheat} = 24 - 20 \text{ kg} = 4 \text{ kg}$$

16. A rod of length $2 \frac{2}{5}$ metre is divided into five equal parts. Find the length of each part so obtained.

Solution:

$$\text{Length of rod} = 2 \frac{2}{5} \text{ m}$$

It is given that the length of rod should be divided into 5 equal parts

$$\text{So the length of each part of rod} = 2 \frac{2}{5} \div 5$$

It can be written as

$$= \frac{12}{5} \times \frac{1}{5}$$

$$= \frac{12}{25} \text{ m}$$

17. If $A = 3 \frac{3}{8}$ and $B = 6 \frac{5}{8}$, find: (i) $A \div B$ (ii) $B \div A$.

Solution:

We know that

$$A = 3 \frac{3}{8} = \frac{27}{8}$$

$$B = 6 \frac{5}{8} = \frac{53}{8}$$

(i) $A \div B$

Substituting the values

$$= \frac{27}{8} \div \frac{53}{8}$$

It can be written as

$$= \frac{27}{8} \times \frac{8}{53}$$

$$= \frac{27}{53}$$

(ii) $B \div A$

Substituting the values

$$= \frac{53}{8} \div \frac{27}{8}$$

It can be written as

$$= \frac{53}{8} \times \frac{8}{27}$$

$$= \frac{53}{27}$$

$$= 1 \frac{26}{27}$$

18. Cost of $3 \frac{5}{7}$ litres of oil is ₹ $83 \frac{1}{2}$. Find the cost of one litre oil.

Solution:

It is given that

$$\text{Cost of } 3 \frac{5}{7} \text{ litres of oil} = ₹ 83 \frac{1}{2}$$

$$\text{So the cost of one litre oil} = ₹ 83 \frac{1}{2} \div 3 \frac{5}{7}$$

It can be written as

$$= ₹ 167 \frac{1}{2} \div \frac{26}{7}$$

We get

$$= ₹ 167 \frac{1}{2} \times \frac{7}{26}$$

$$= ₹ \frac{1169}{52}$$

$$= ₹ 22 \frac{25}{52}$$

19. The product of two numbers is $20 \frac{5}{7}$. If one of these numbers is $6 \frac{2}{3}$, find the other.

Solution:

It is given that

$$\text{Product of two numbers} = 20 \frac{5}{7} = \frac{145}{7}$$

$$\text{One number} = 6 \frac{2}{3} = \frac{20}{3}$$

$$\text{So the other number} = \frac{145}{7} \div \frac{20}{3}$$

By further calculation

$$= \frac{145}{7} \times \frac{3}{20}$$

So we get

$$= \frac{87}{28}$$

$$= 3 \frac{3}{28}$$

20. By what number should $5 \frac{5}{6}$ be multiplied to get $3 \frac{1}{3}$?

Solution:

$$\text{Here the required number} = 3 \frac{1}{3} \div 5 \frac{5}{6}$$

It can be written as

$$= \frac{10}{3} \div \frac{35}{6}$$

So we get

$$= \frac{10}{3} \times \frac{6}{35}$$

$$= \frac{4}{7}$$
